## **FOR IMMEDIATE RELEASE**

### **XPULSE RELEASES *SURVEY ON CONNECTION™***

**CALGARY** – The successful *Survey on Connection™ (SOC)* from XPulse will be available in larger quantities for the 2006-07 drilling season. The highly sought after system has been outperforming competitors with its unique characteristics and time saving results. XPulse has set a goal to manufacture and make available 100 systems during the upcoming drill season due to increased demand.

Unlike conventional wellbore monitoring systems, XPulse automatically returns a survey every time a new connection is made. The surveys are immediate and no downtime occurs showing a Net Zero effect on drilling time for jointed pipe systems. The data is automatically decoded, displayed and networked around the location with no operator involvement. "Frequent surveys mean better information for drilling teams, which in turn helps the rig hit the target on time and on budget," said Stuart Britton, General Manager of XPulse.

XPulse is also set apart from competitor tools by its reliability. Although unmanned, XPulse is remotely monitored and experienced technicians are available for trouble shooting should any occur. XPulse comes in standardized sizes and can be used in jointed pipe or coiled tubing applications. **Call today for pricing and availability.**

Calgary based Extreme Engineering is a multi-talented, multi-faceted group of industry experts that develop and manufacture custom MWD and LWD drilling telemetry for several of the major service companies in North America. Incorporated in 2001, Extreme is currently composed of 50 staff operating out of a 22,000 sq ft facility.
